

Noise Barriers for Motorways & Railways in the European Union – European Regulations & Construction Tec  
Thessaloniki Greece 20

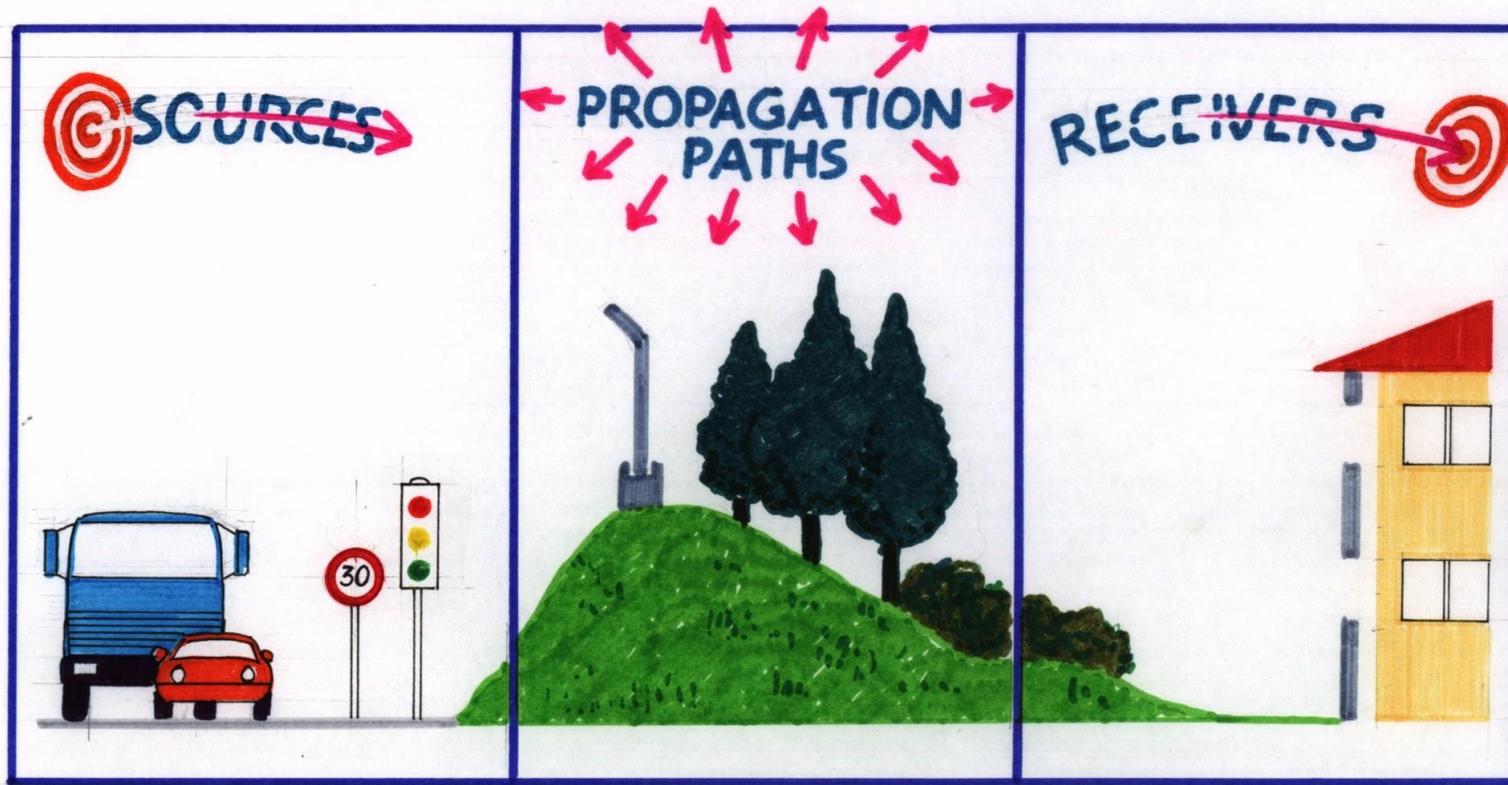

A cost-benefit evaluation of Noise Barriers shows positive outcomes when the products meet the criteria of durability & sustainability

Giovanni Brero ERF\_ENBF\_UNICMI Road & Rail Equipment working groups  
Member of CEN standardization technical committees  
Noise Expert in DGENV EU Commission

## Summary:

- Noise barriers as a tool for noise reduction strategy
- Design activities
- Product/system performance
- Focus on durability & sustainability

**EXPECTED INSERTION LOSS VS POPULATION INVOLVED**

- 4 dB(A)

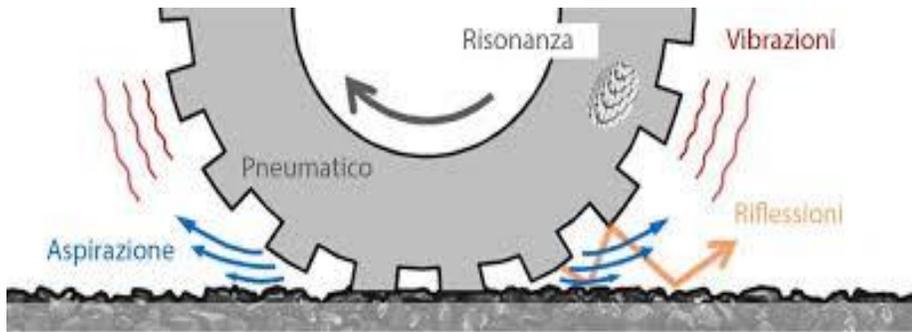

-10 up to -20 dB(A)

> 20 dB(A)

**FOR ALL RECEIVERS**

**FOR MANY  
REVEICERS**

**FOR A FEW RECEIVERS**

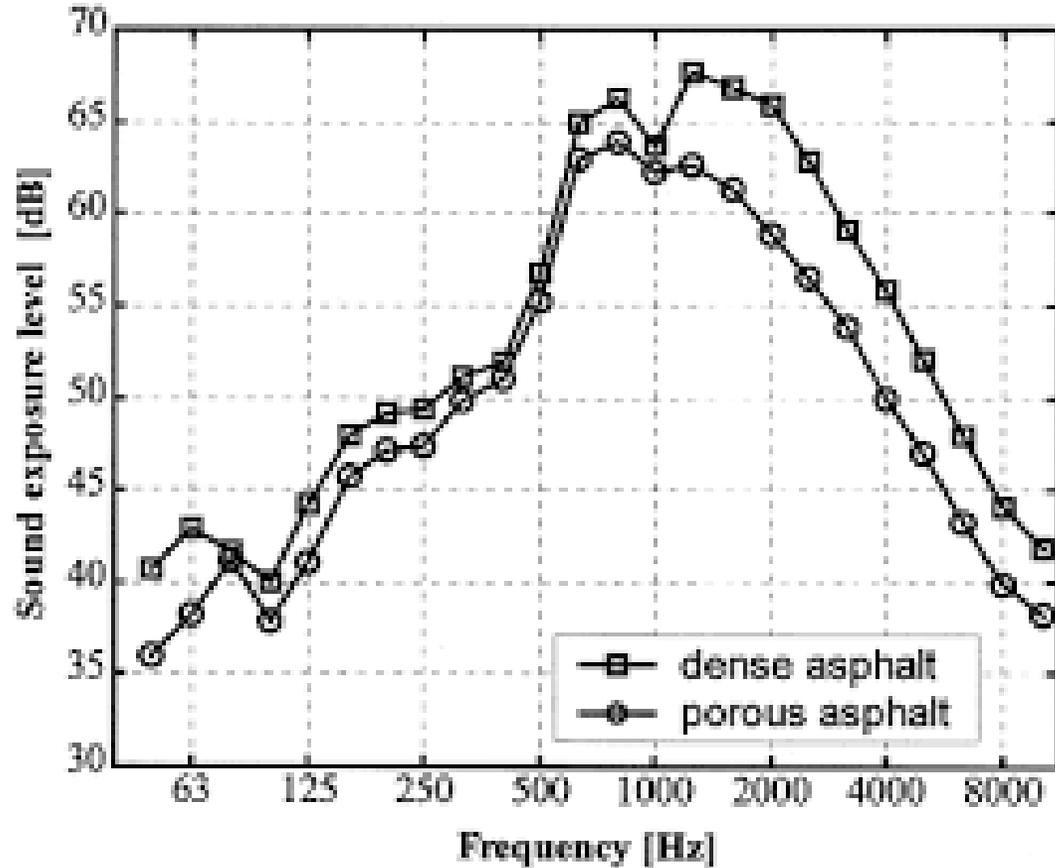

Porous asphalt case

Tyre Noise label

## Combination of porous asphalt and noise barrier: any chance?

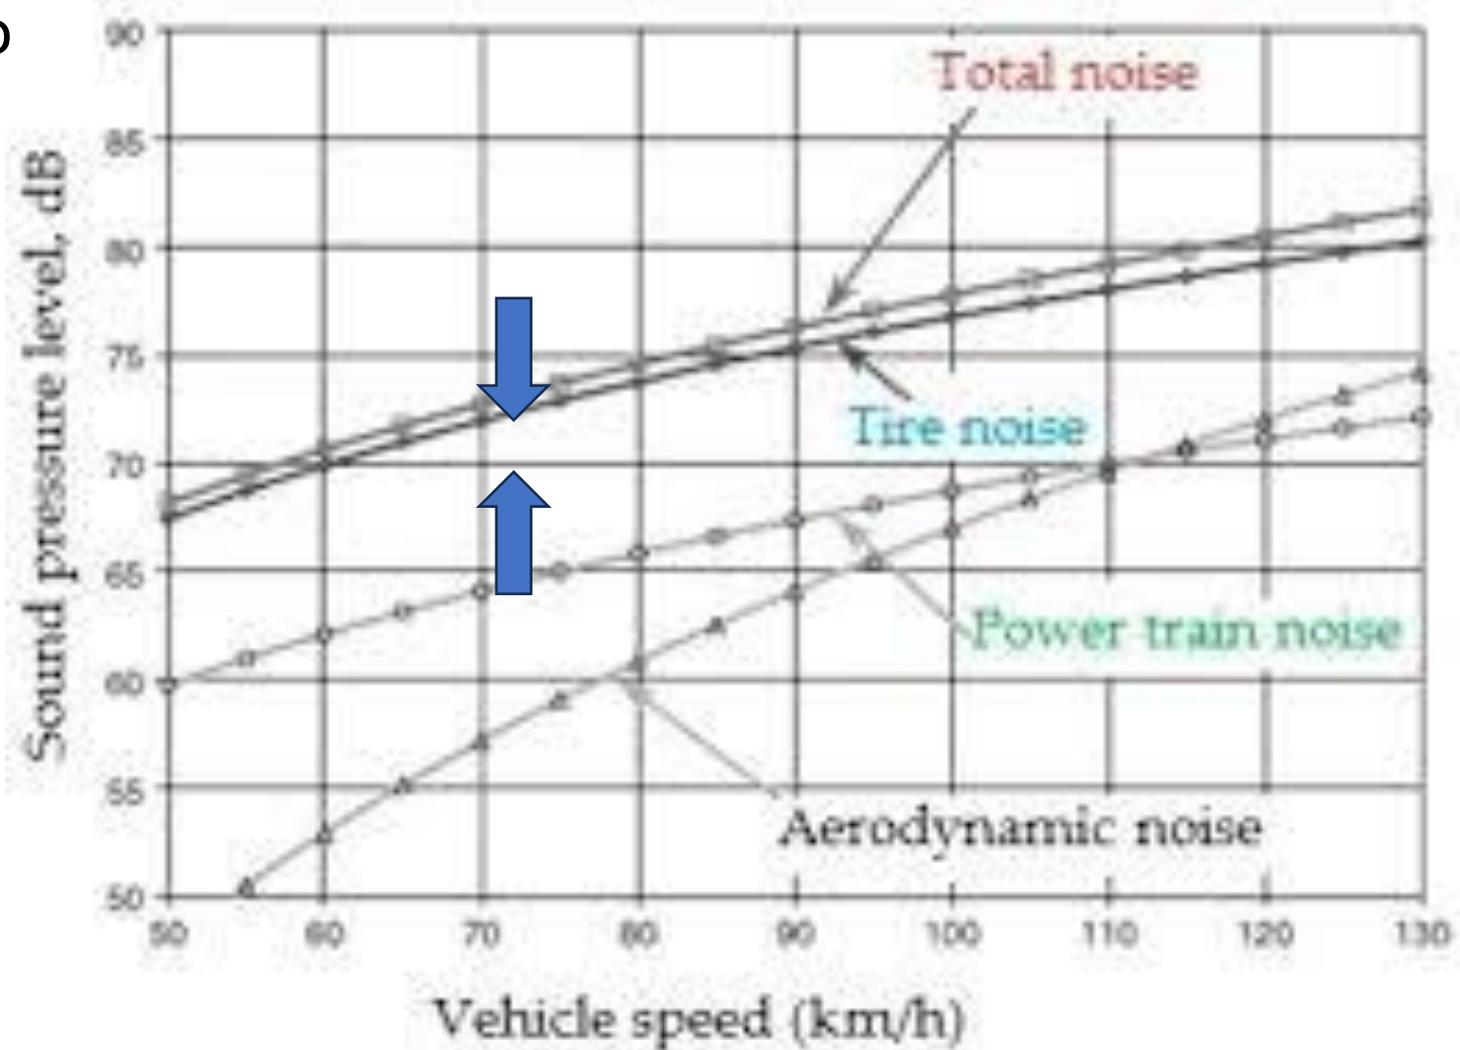

- Conventional porous asphalt effect is evident over 500 Hz third octave band
- Effect of noise barrier due to diffraction is expected in the same frequency range
- This is not a favourable condition as total results is not the mere summation of the effects; i.e.
  - IL (measured behind a noise barrier) = 15 dB
  - IL (measured with a porous asphalt) = 4 dB
  - IL (measured with their combination) = 16 dB

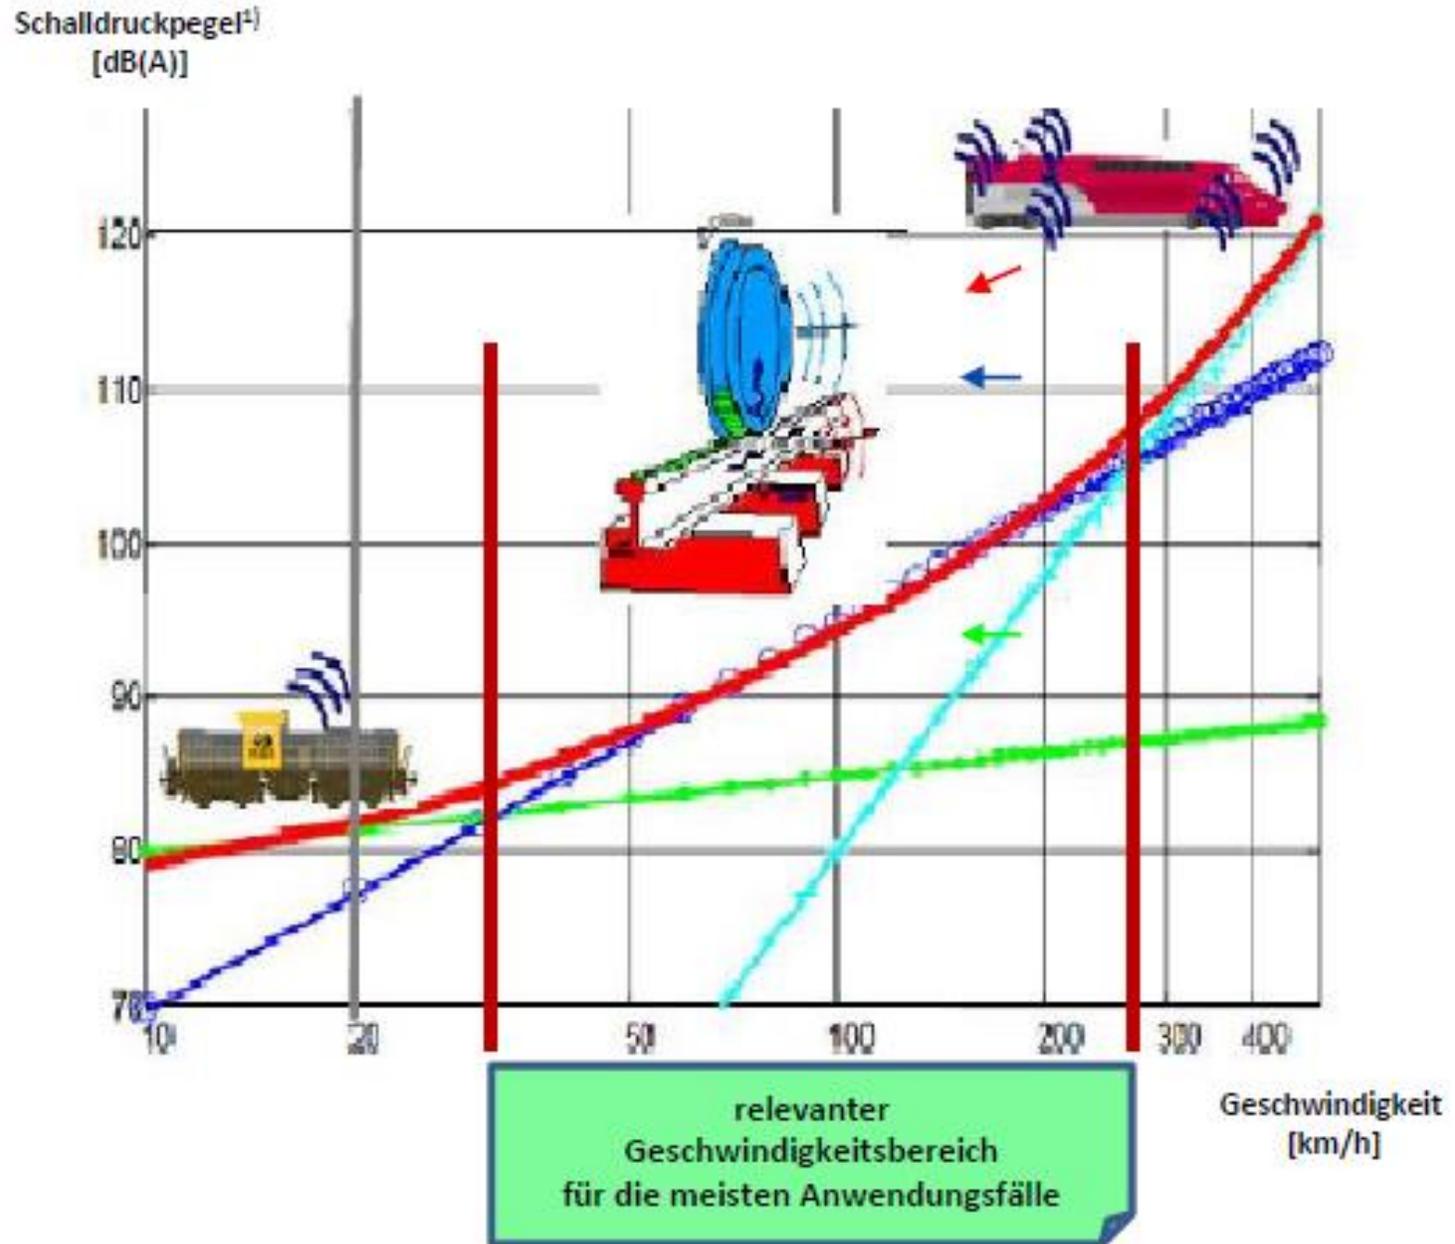

## Electric mobility: possible scenario

Road traffic noise sources  
 Expressway motorway  
 Light vehicle case

rail sector case

In the rail sector

Absorbing track surface - Close proximity barrier - Rail dumper - Low height noise barrier

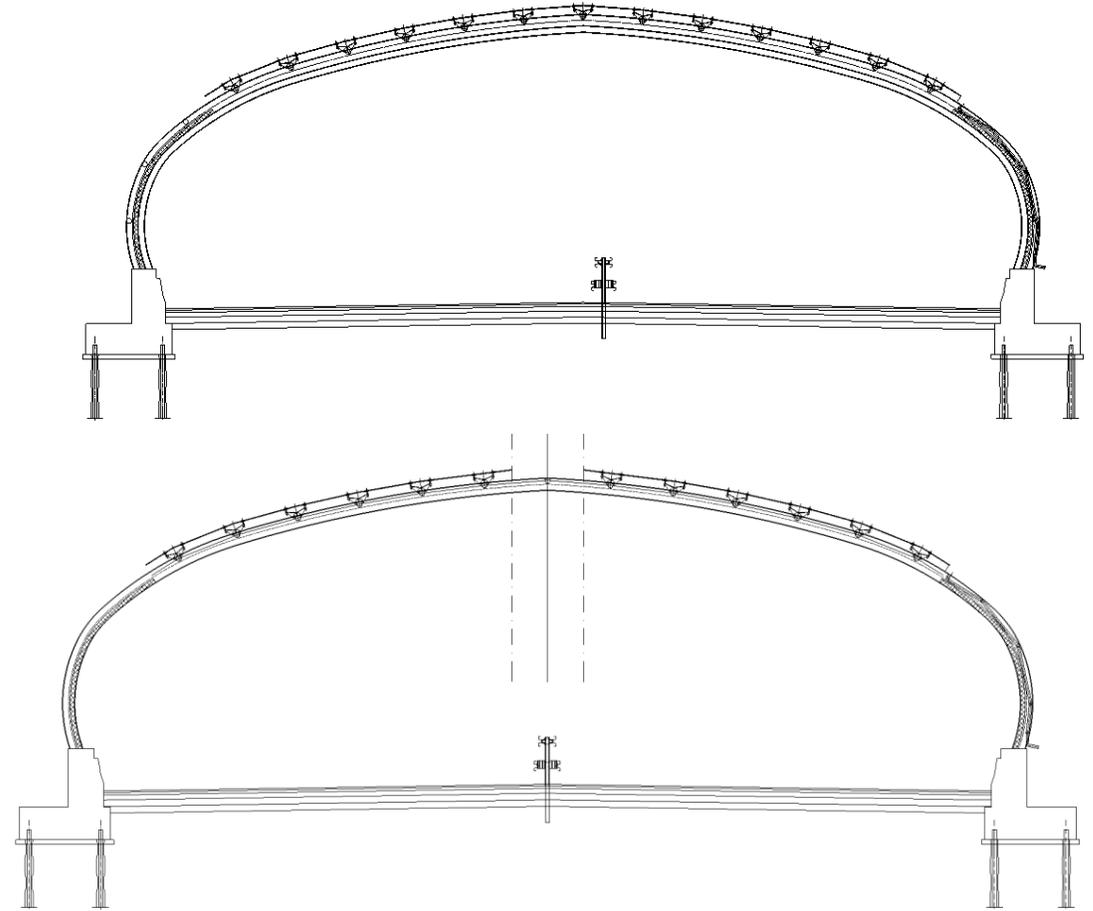

Electric mobility will not provide a solution in extra urban areas

Action on road surface can ensure a moderate noise reduction for many receivers

Action on the building can ensure an high noise reduction for a few receivers

Noise barriers (or covering) remains the unique approach in case a significative noise reduction is required for many receivers

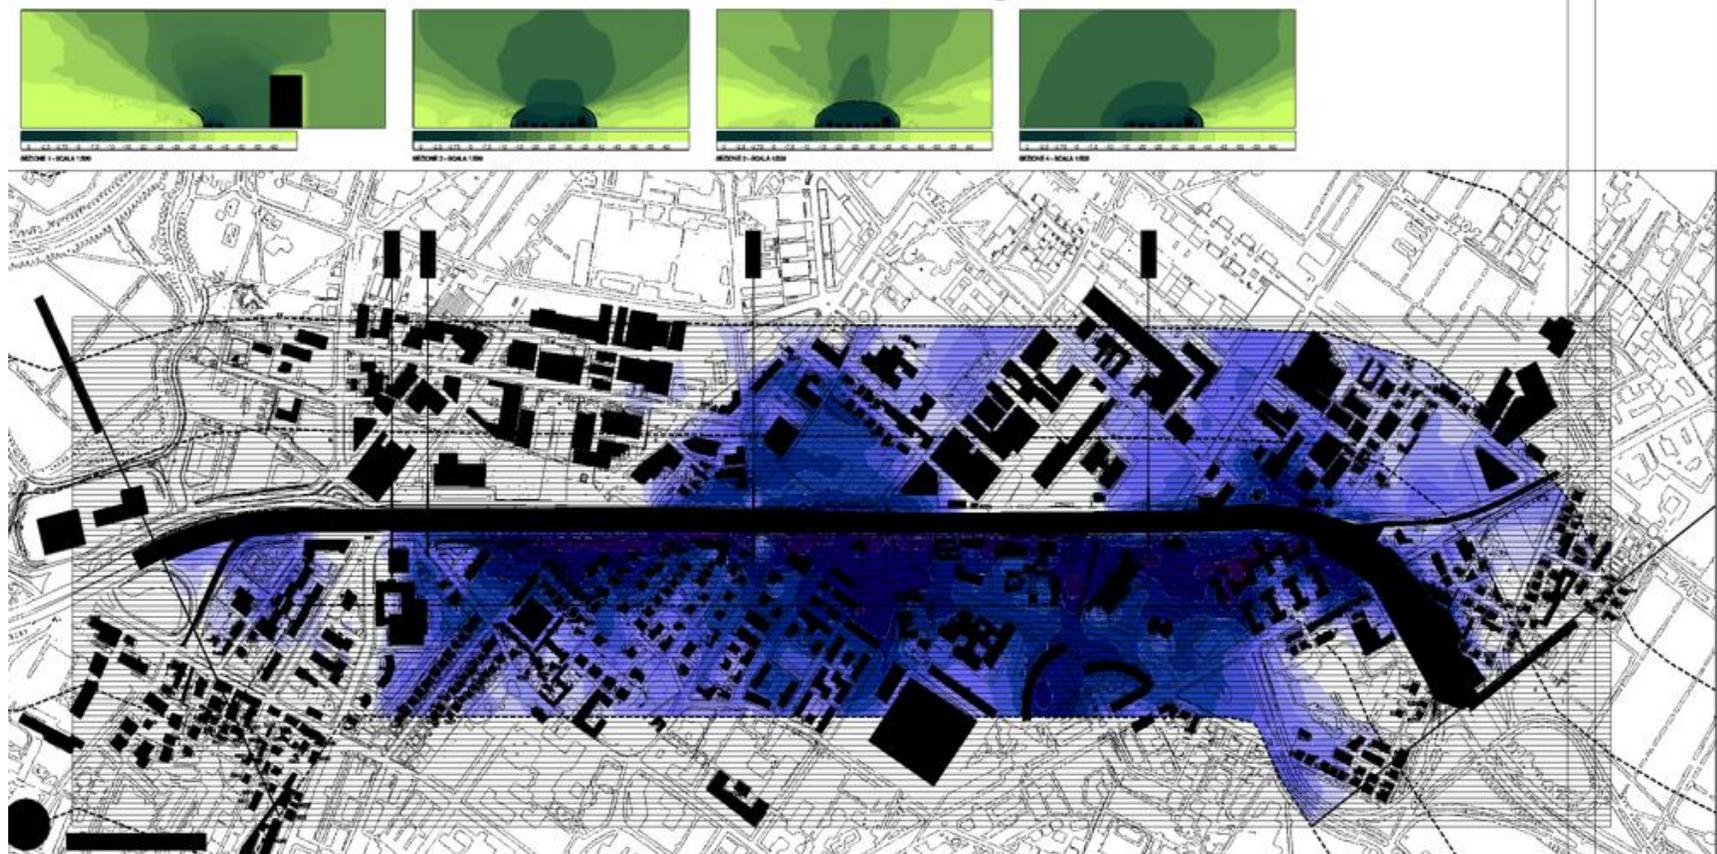

How to address public resources for traffic noise reduction ?

Option a )

Use available fundings for a few decibel reduction on the whole network ?

Option b )

Start focusing on the black spots to achieve a significant noise reduction for more exposed receivers ?

***Let's start with the word we use:***

**Noise barriers  
Larmschutz  
Barriera antirumore**

**or**

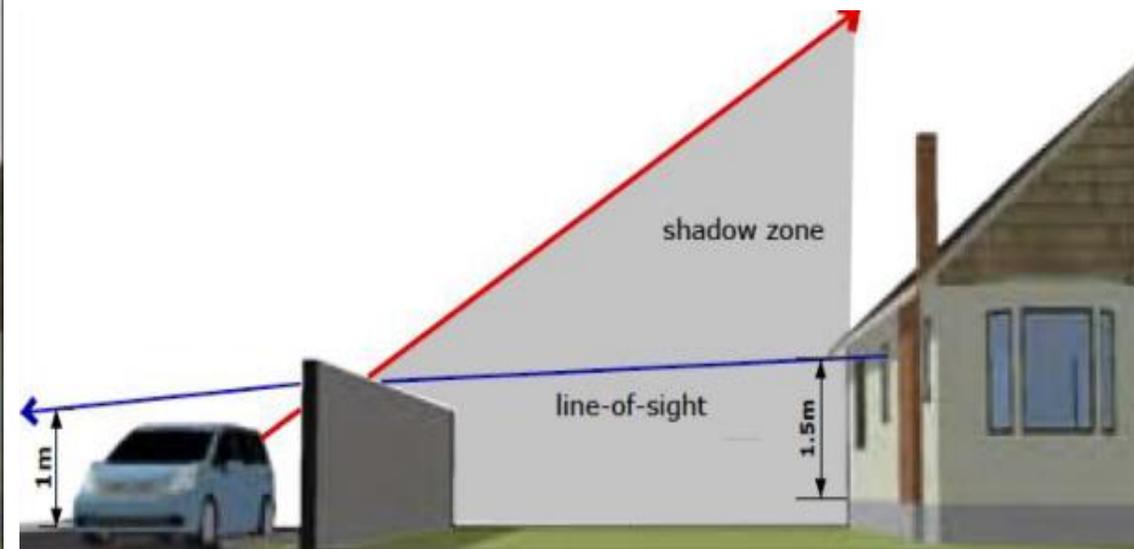

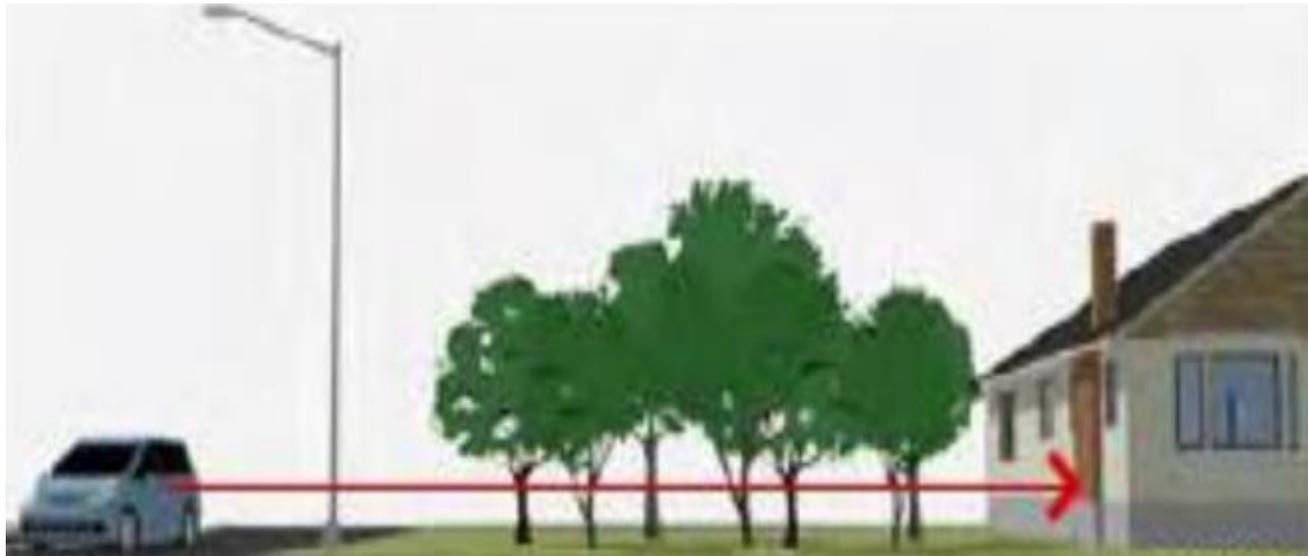

**Ecran antibruit  
Geluidsscherm**

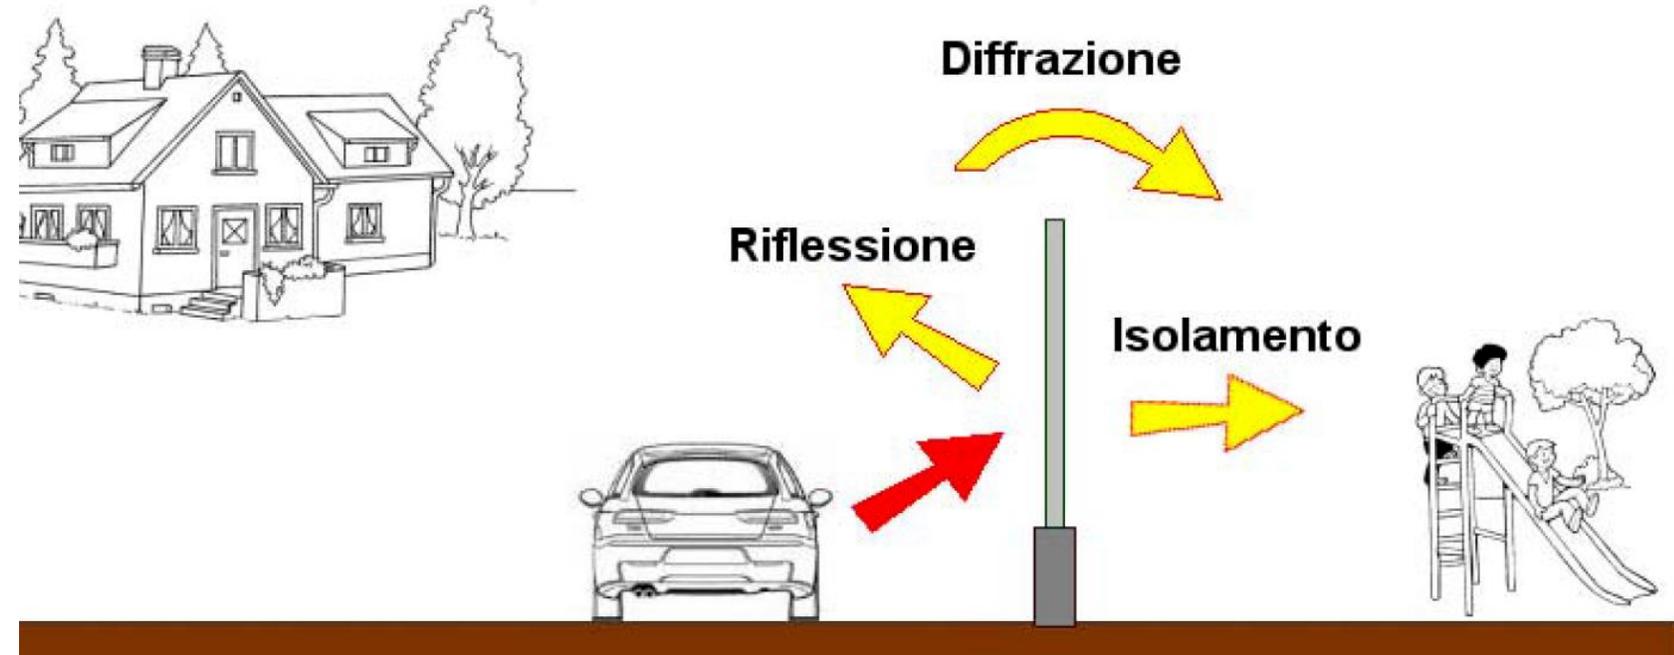

**ΗΧΟΠΕΤΑΣΜΑ (ΙΗΟΡΕΤΑΣΜΑ)**

Target of the acoustic design of the noise barrier:

To improve its extrinsic performance

Characterized by the Insertion Loss IL: difference of noise levels without and with the noise barrier

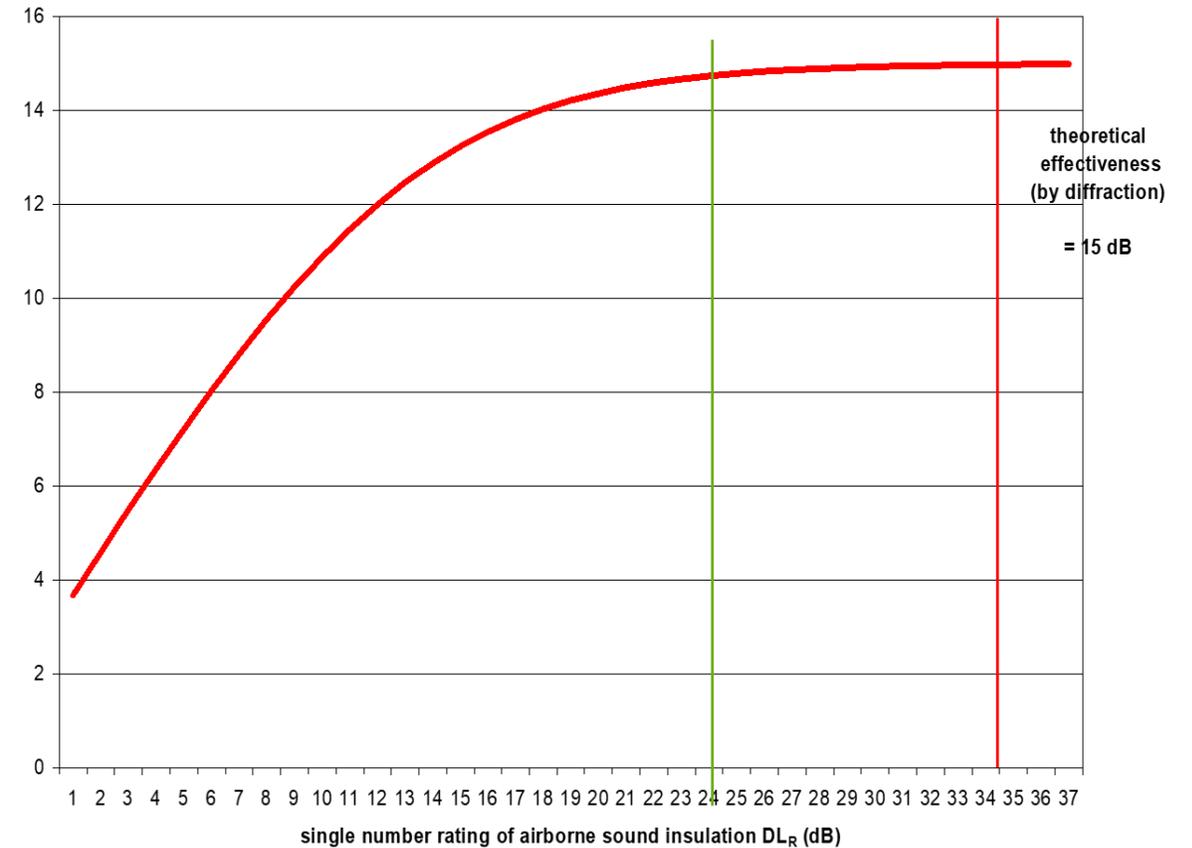

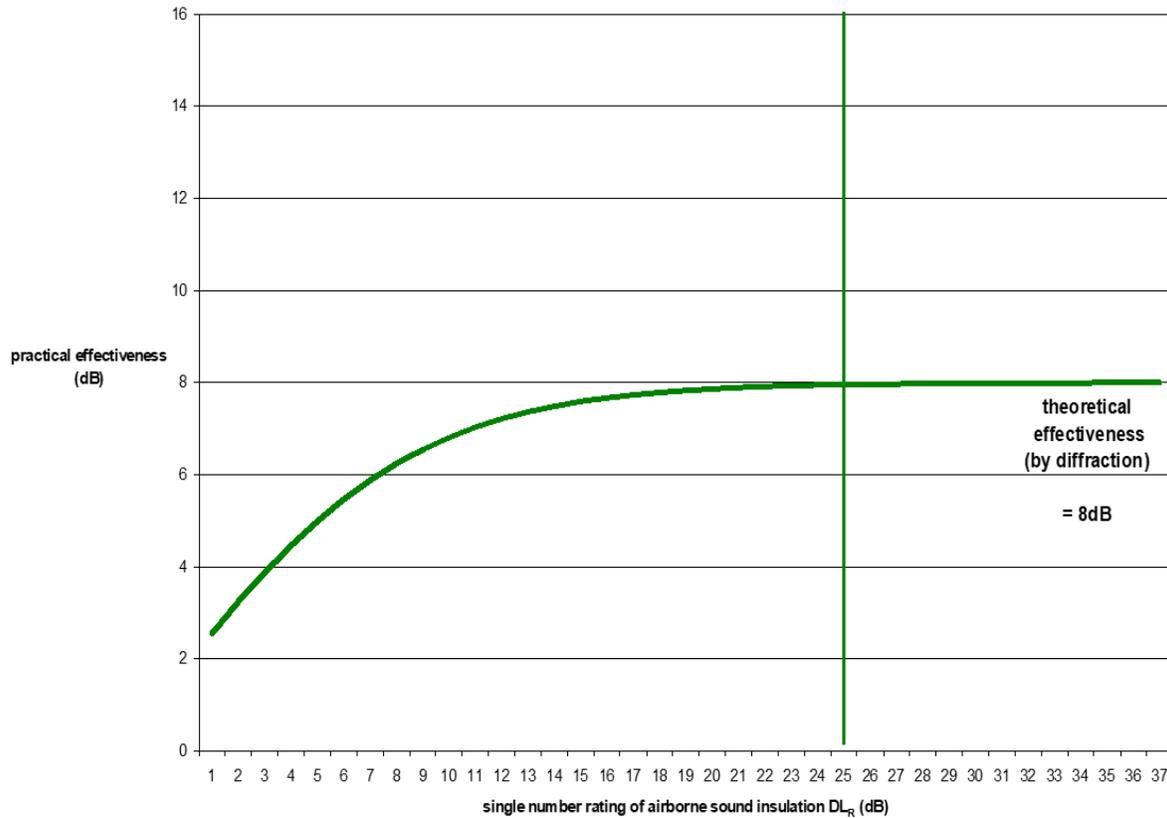

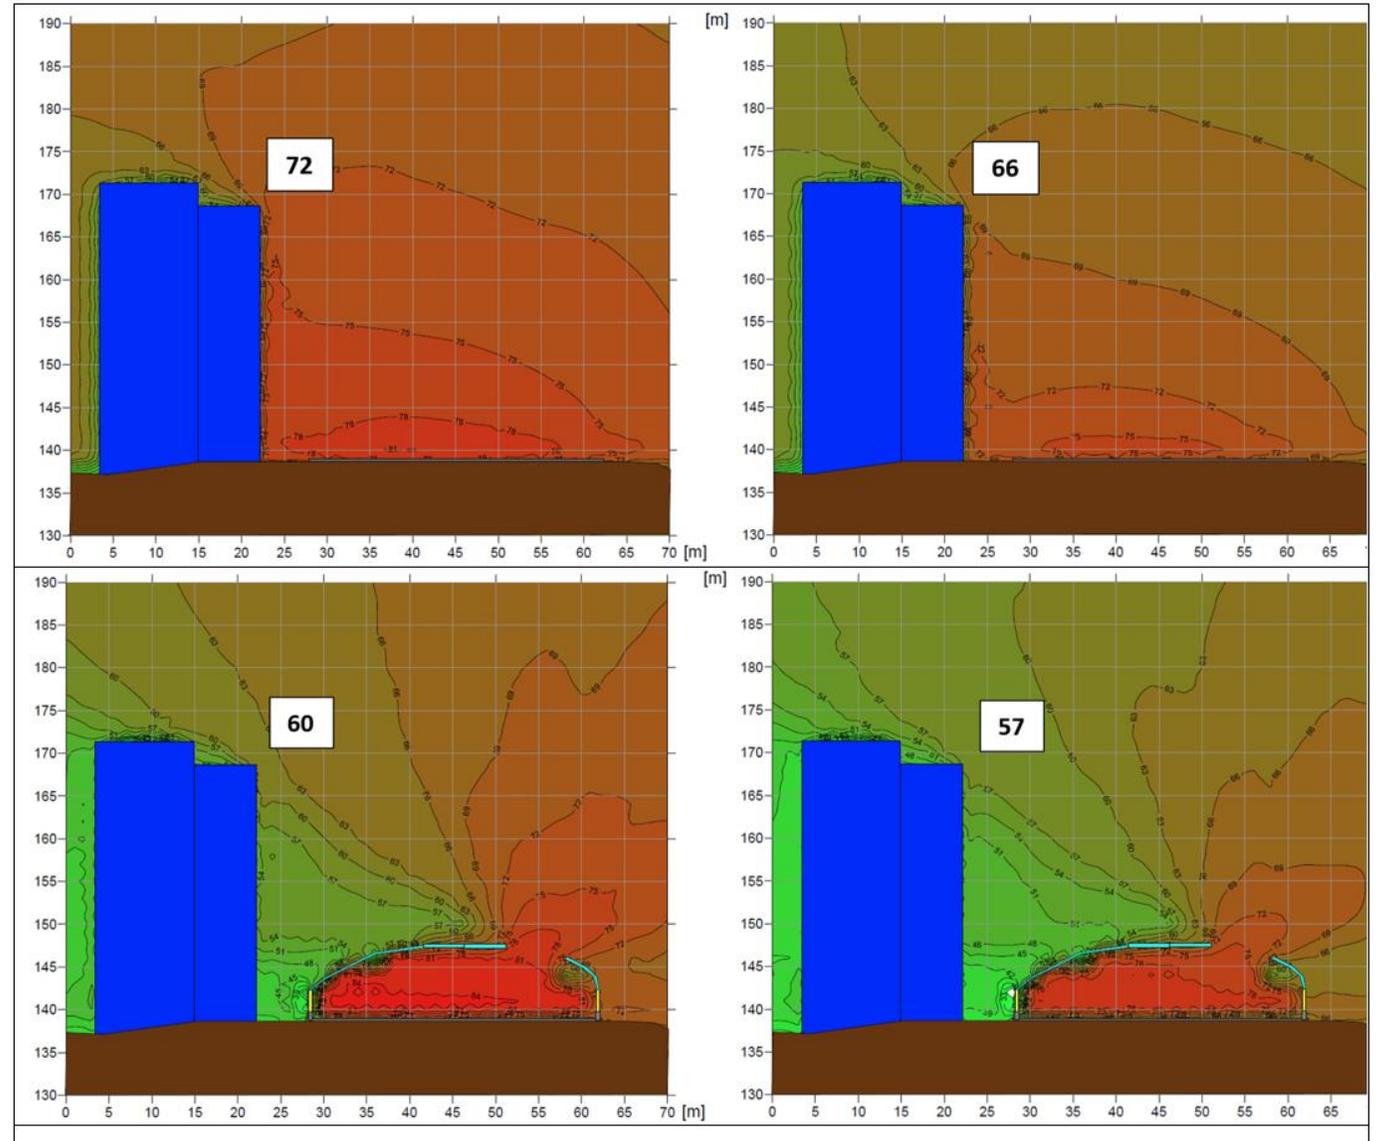

Acoustic design steps:

- 1 - calculation based on **diffraction**: the height and the length of the noise barrier is defined to achieve the noise reduction required at receiver point
- 2 - choice of the noise barrier type to achieve maximum **acoustic insulation** requested
- 3 - choice of the noise barrier type to achieve maximum **acoustic absorption (minimum reflection)** requested

- Once the expected effectiveness by diffraction is defined,
- the optimal acoustic insulation is calculated
  - choice of the materials (depending on the surface mass)

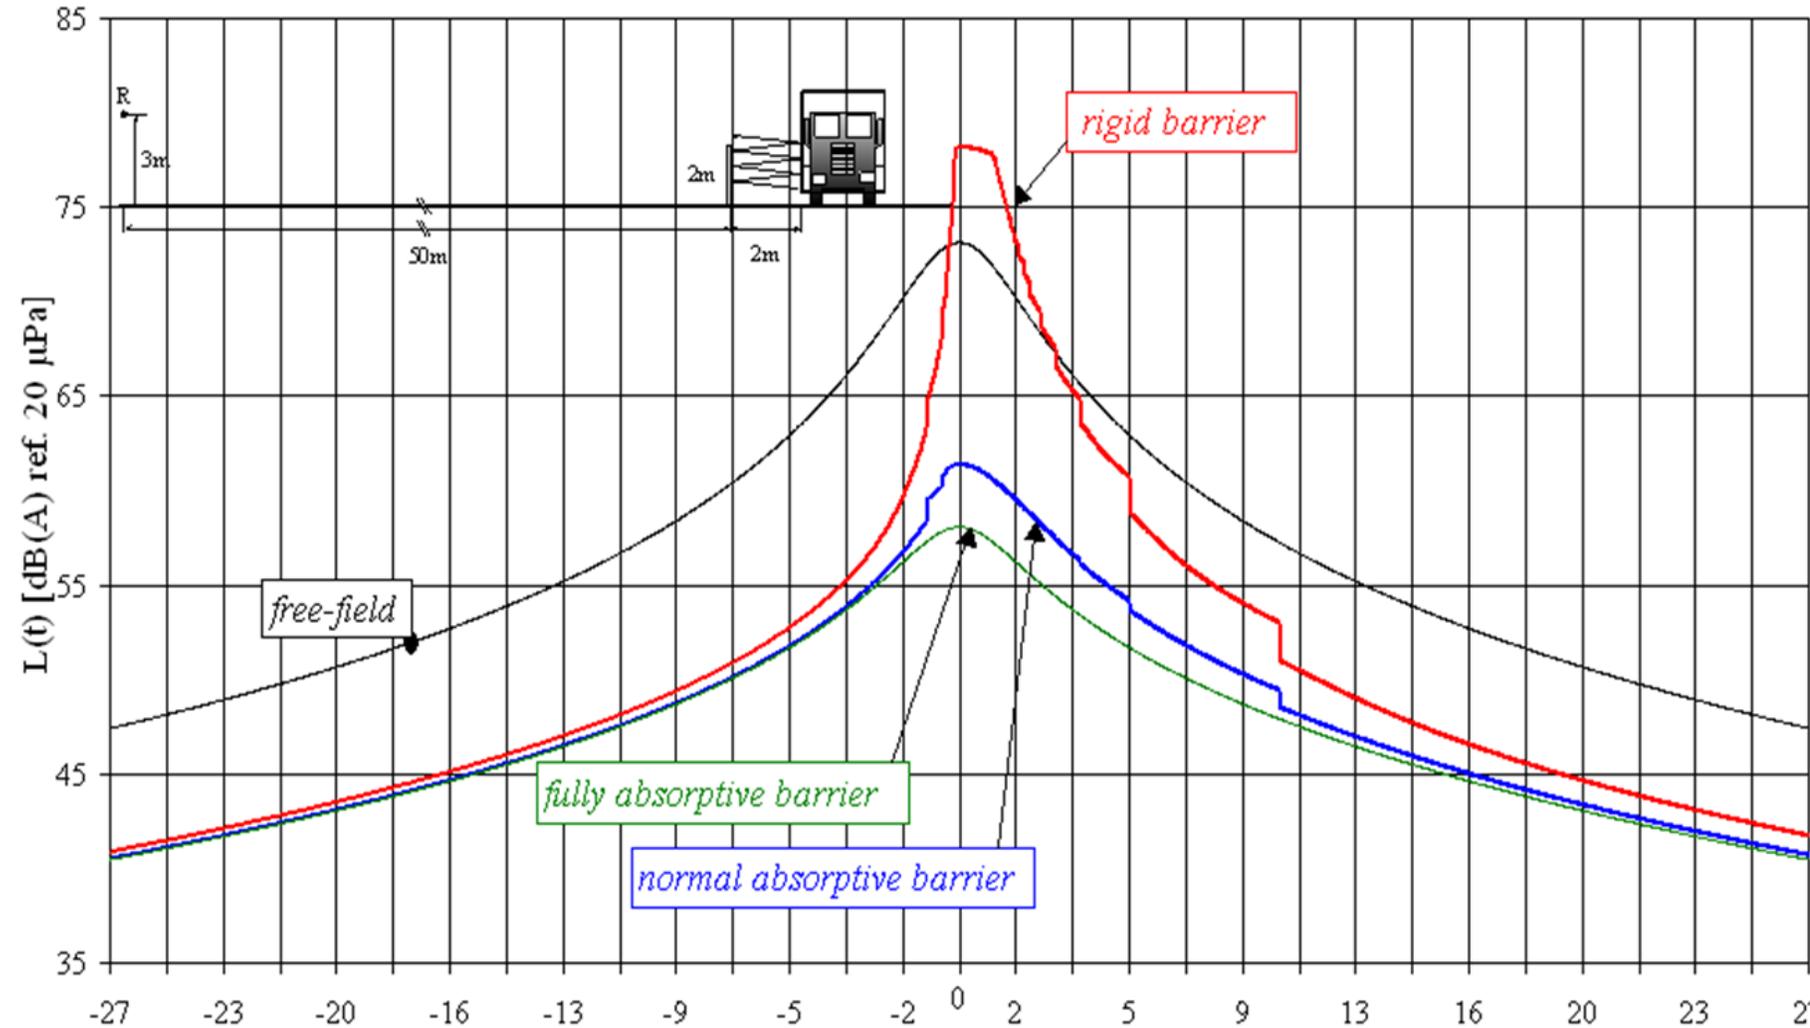

Acoustic modeling tools  
 Insertion loss achieved with a  
 noise barrier partially spanning  
 over the road

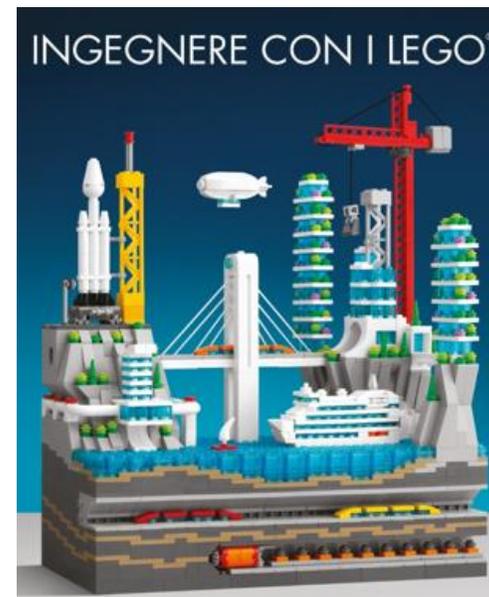

Minimizing the noise reflected by the barrier to:

- avoid any increase of noise levels in the screened area behind the barrier.
- Minimise the multiple reflection effect between the vehicles and the barriers (the figure aside show the potential consequences at the receiver point for a truck pass-by measurement)

## Material > Construction

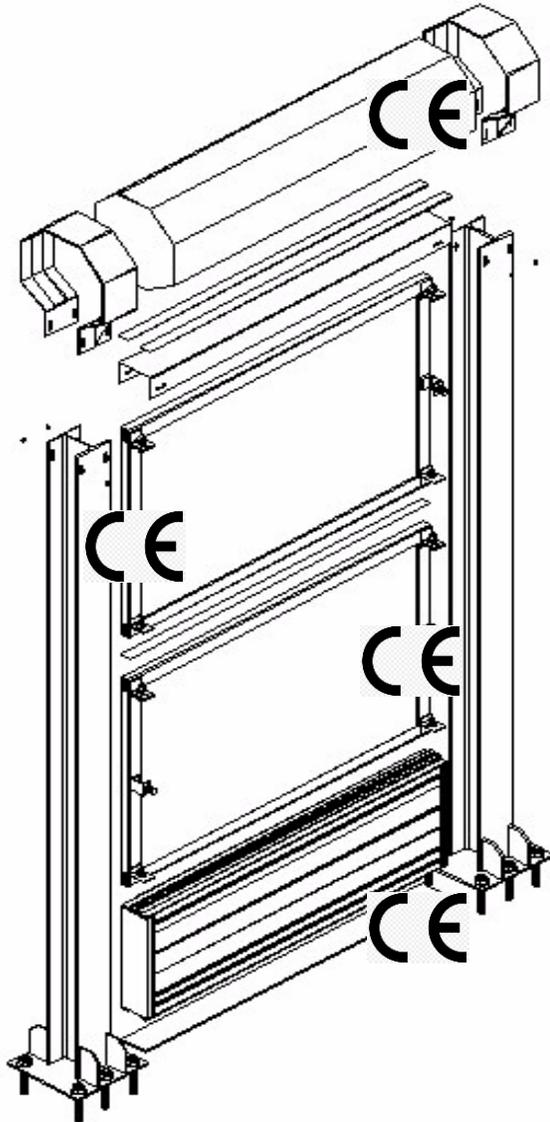

## Products > Construction

Performance declared for essential characteristics, i.e.:

Sound insulation  
 Sound absorption  
 Mechanical performance  
 Safety performance  
 Durability  
 Sustainability

Basic work requirements :

- 1 - Structural integrity of construction works
- 2 - Fire safety of c.v.
- 3 - Protection against adverse hygiene and health impacts related to c.w.
- 4 - Safety and accessibility of c.w.
- 5 - Resistance to the passage of sound and acoustic properties of c.w.
- 6 - Energy efficiency and thermal performance of c.w.
- 7 - Emissions into the outdoor environment of c.w.
- 8 - Sustainable use of natural resources of c.w.

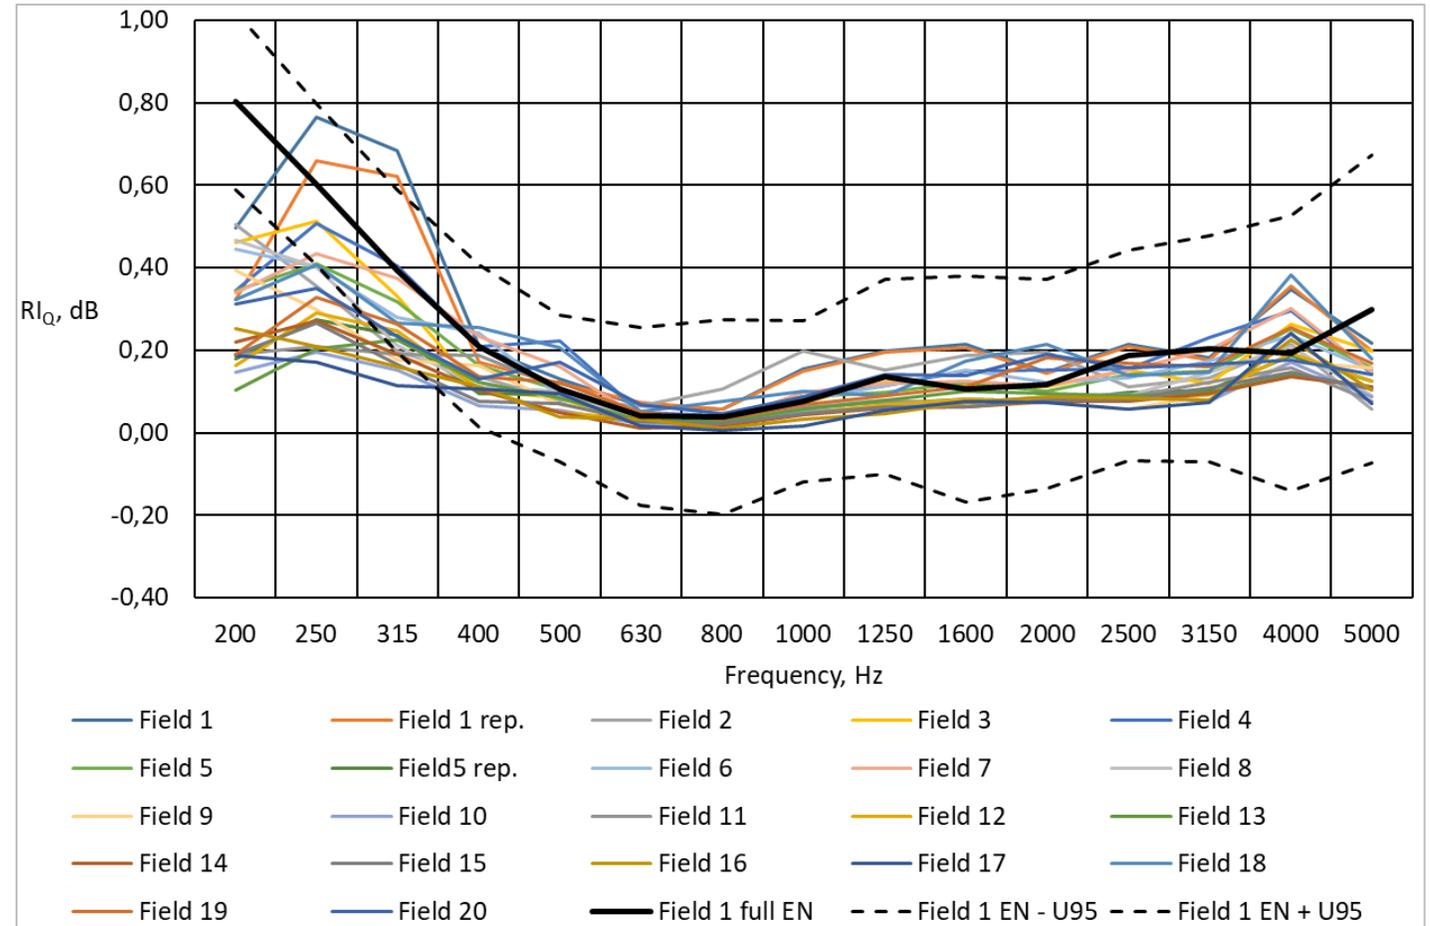

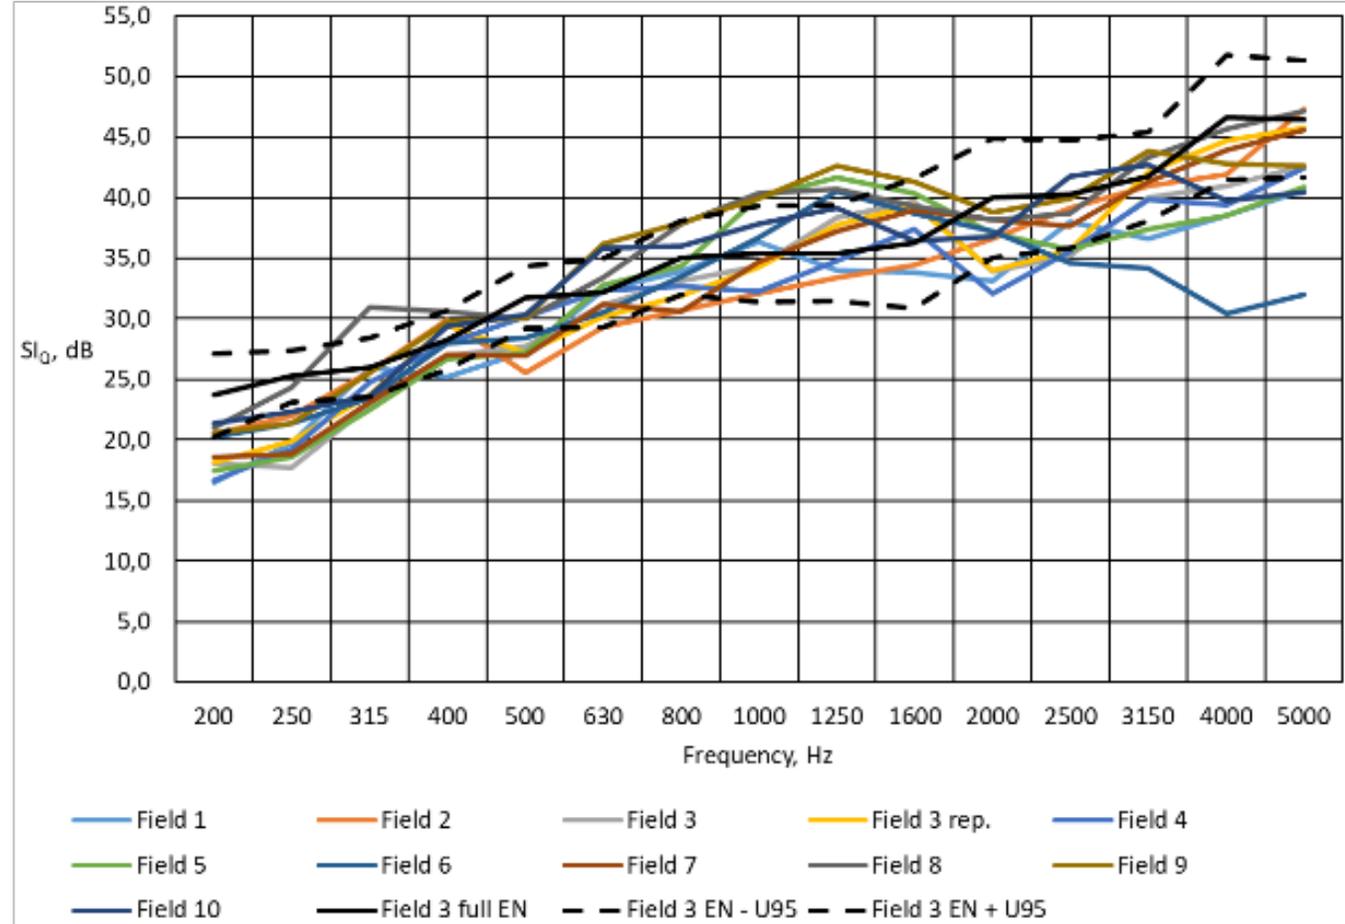

Example of noise barrier components:

- Structural post, i.e. HE steel profiles + base plate + anchor bolts
- Cassette metallic panels with inner absorbing material
- Transparent modules, i.e. PMMA solid sheet + EPDM gasket and metallic frame
- Added device + clamping system

CE marking is NOT an OPTION for ROAD applications  
Homologation is requested for RAIL applications

For both a common set of technical standards is developed by:  
CEN TC 226 Road Equipment WG 6 Anti noise devices  
CEN TC 256 SC1 WG 40 Noise barriers

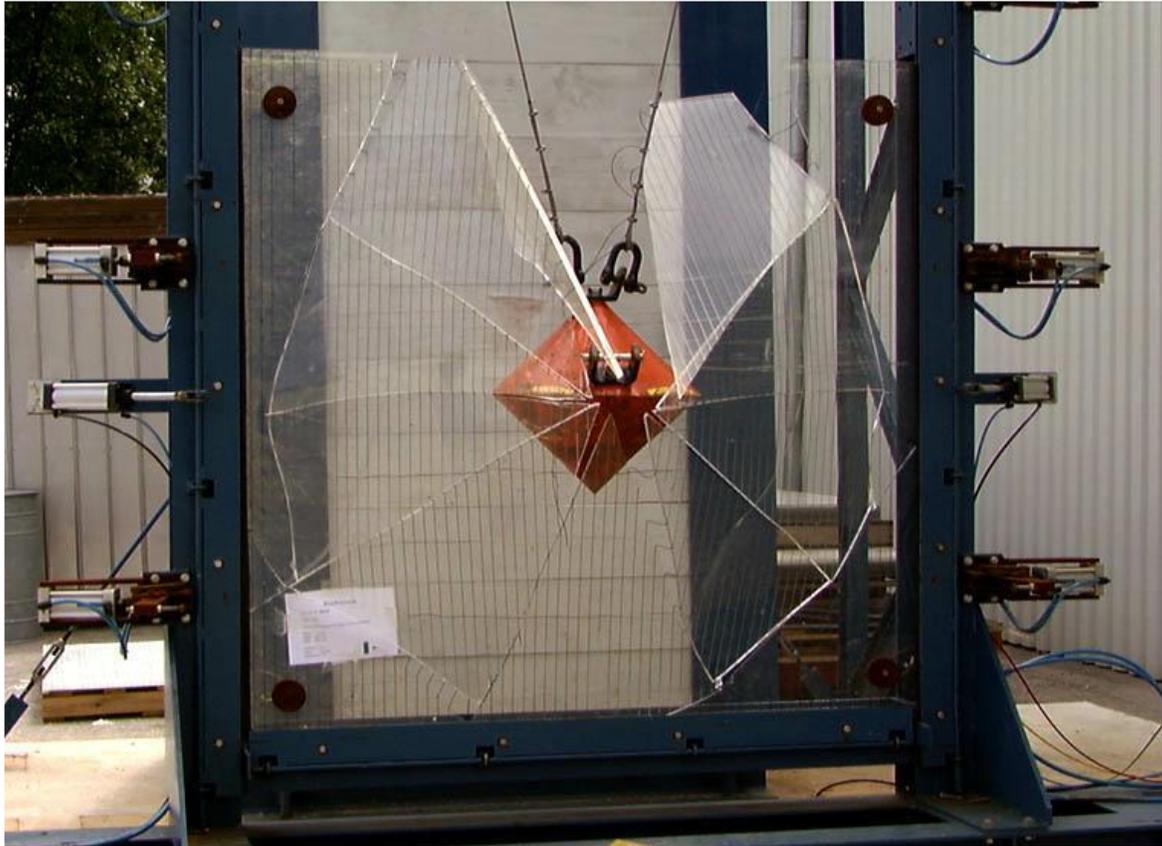

Resistance to load of acoustic panels measured in laboratory

Resistance to load of the whole noise barrier calculated in situ

Resistance to impact loads of the acoustic element measured in laboratory

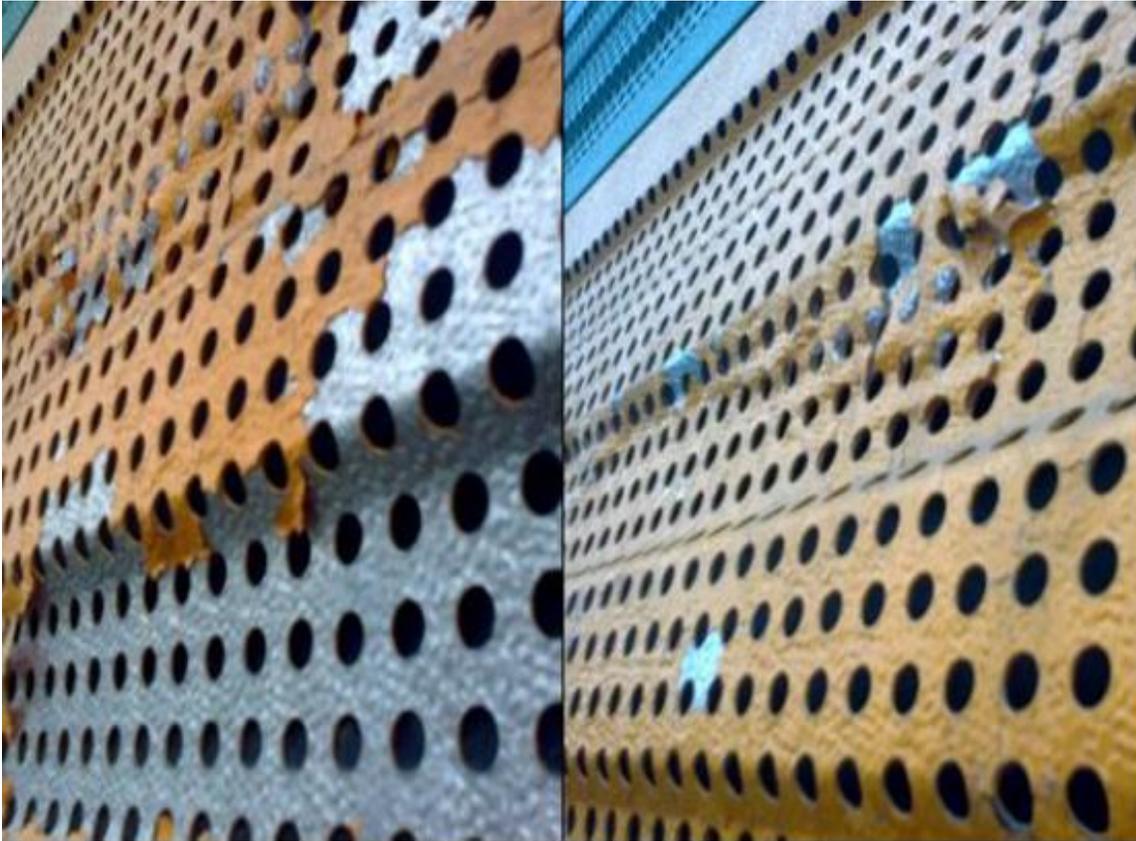

Safety of the noise barrier ensured in situ by a correct design

The installation manual is prepared by the noise barrier manufacturer

Specialized contractors (especially in the rail sector) need to be involved for the installation

Durability is declared by the manufacturer according to EN 14389 together with the maintenance manual  
Inspection and maintenance activities are part of the design process  
Examples are given for metal or timber surface protection

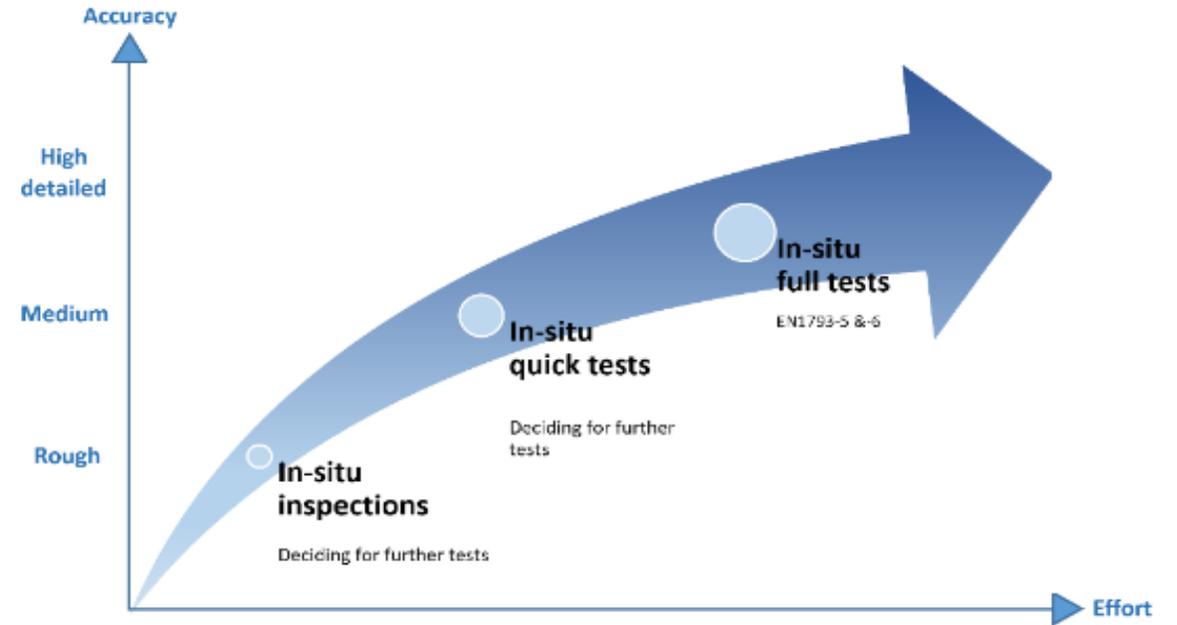

Examples are given for rockwool layer defects

Examples are given for damages occurred to the road that are detrimental for the noise barrier performance

Durability affected by vandalism or accident combined with lack of maintenance

| NB inspection protocol<br>Sheet 1: Location |  |

## Research project : SOPRANOISE

- Securing and **O**ptimizing the **P**erformance of **R**oad tr**A**ffic noise barriers with **N**ew meth**O**ds and **I**n- **S**itu **E**valuation
- European research funded by **CEDR** (Conference of European Directors of Roads)
- Simplified methods to characterize the in-situ intrinsic acoustic performances of noise barriers

How Sustainability can be defined ?

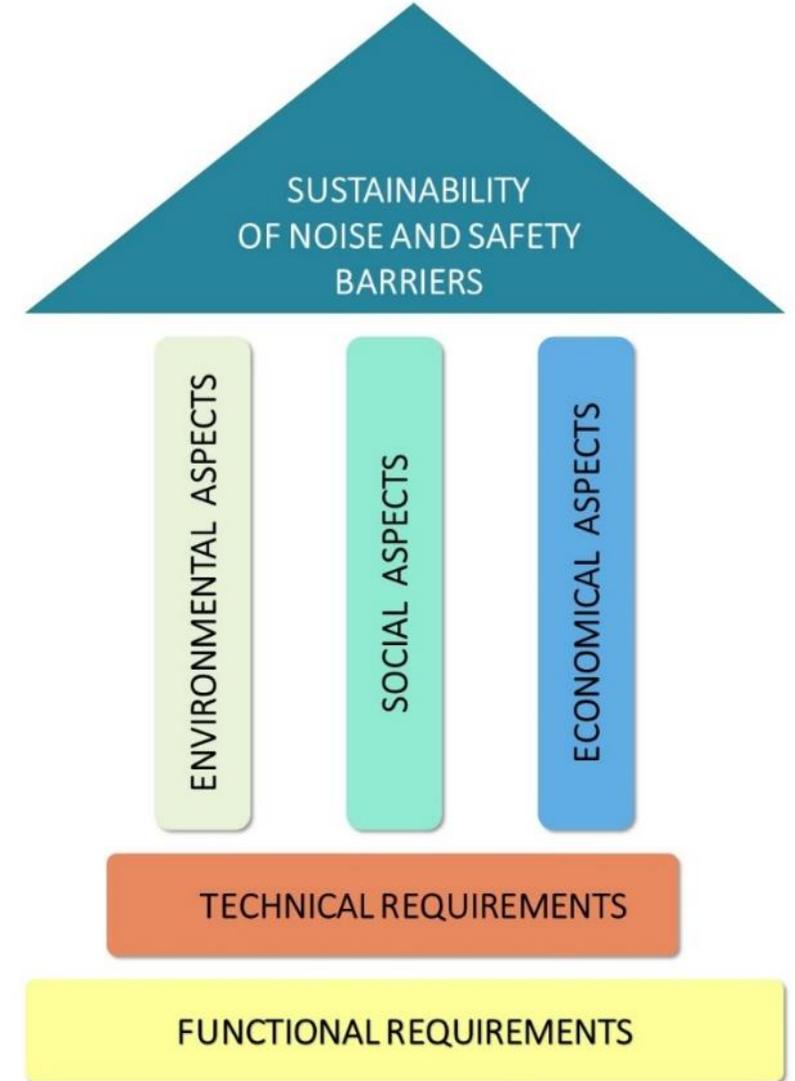

for a noise barrier project:

**technical (and functional) requirements represents the basement** design technical specification to be fulfilled, on the top of that for each project:

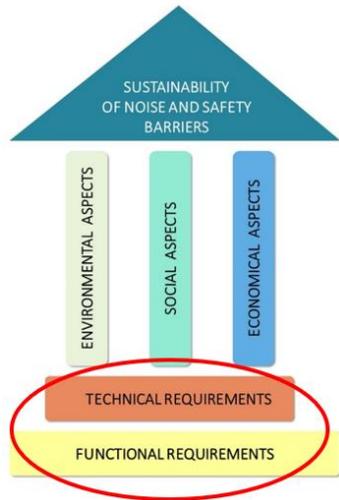

**economic,**

**social,**

**and environmental requirements** need then to be considered.

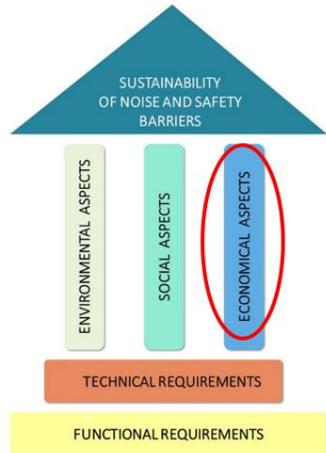

## ESSENTIAL REQUIREMENTS FOR NOISE BARRIERS ACCORDING TO CPR 305/2011 (today under revision)

1. Mechanical resistance and stability
2. Safety in case of fire
3. Hygiene, health and the environment
4. Safety and accessibility in use
5. Protection against noise
6. Energy economy and heat retention
7. Sustainable use of natural resources

## Economic sustainability

different approaches for Noise barriers:

- Cost / Benefit evaluation  
(take into account new functionalities of Noise barriers  
(energy production, use of the surface...))
- Willingness to pay for noise reduction

> Studi sull'ambiente | > Aria / Rumore / RMI / Economia

**17**  
**07**

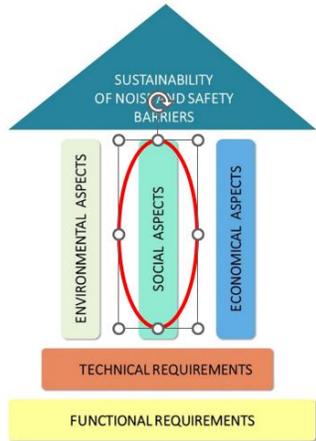

**> Disponibilità a pagare per il miglioramento della qualità ambientale nel luogo di residenza**

*Stime per le città di Zurigo e Lugano relative all'inquinamento atmosferico, all'esposizione al rumore e all'elettrosmog dovuto alle antenne di telefonia mobile*

Schweizerische Eidgenossenschaft  
Confédération suisse  
Confederazione Svizzera  
Confederaziun svizra

Ufficio federale dell'ambiente UFAM

cepe  
Centre for Energy Policy and Economics  
Swiss Federal Institute of Technology

## Social sustainability:

- Impact on landscape
- Obstruction of the view
- Shadowing
- Security

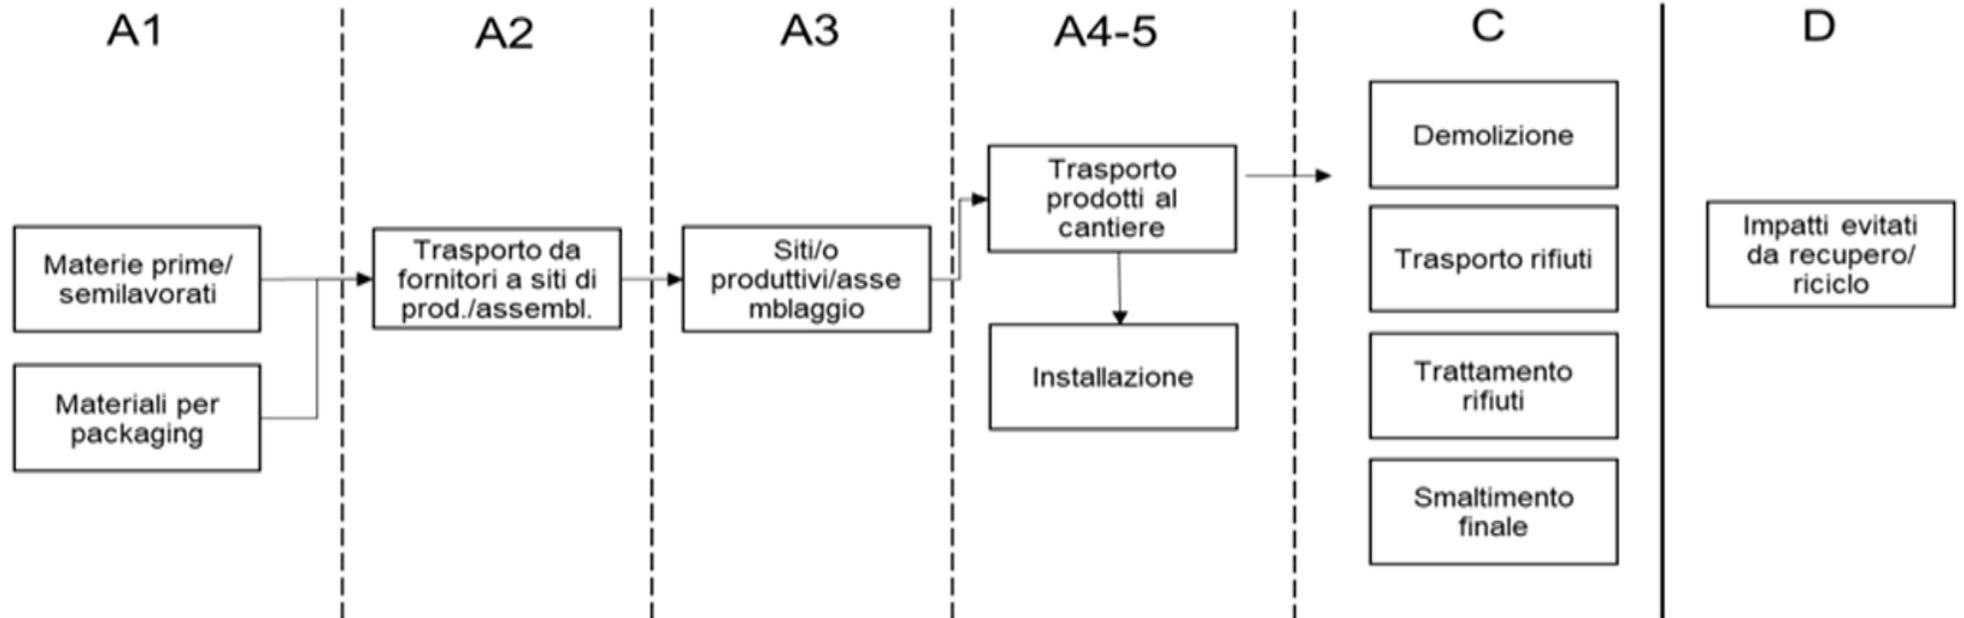

## Environmental sustainability:

EN 17383

<http://www.environdec.com/>

LCA based on the set of indicators over the whole life cycle defined in EN15804:2019.

## PROCEEDR - OPTimising Resource Use for Roadside Infrastructures

| Material     | Details                        |
|--------------|--------------------------------|
| Aluminium    | Rock wool or polyester filling |
| Steel        | Rock wool or polyester filling |
| Recycled PVC | polyester filling              |
| Glass        | + steel frame + EPDM gaskets   |
| PMMA         | + steel frame + EPDM gaskets   |
| Wood         | Timber frame + HDPE sheet      |

## Life cycle stages to be considered

|                    | Product stage       |           |               | Construction process stage |                           | Use stage |             |        |             |               |                        |                       | End of life stage          |           |                  |          | Resource recovery stage            |

*Additional voluntary indicators e.g. the voluntary indicators from EN 15804 or the global indicators according to ISO 21930:2017*

How to implement environmental sustainability in GPP ?

- Confine declarations to modules A
- Eventually extended to modules C
- Clarify the use of module D
- Defined appropriate scenario for modules B
  
- Identify a global indicator i.e.:

The Environmental Cost Indicator (ECI) is a single-score indicator expressed in Euro.

## PROMOTING SUSTAINABLE ROADS THROUGH PUBLIC PROCUREMENT

ENCOURAGING INNOVATION AND SUSTAINABILITY IN THE ROAD INFRASTRUCTURE SECTOR WHILE MODERNISING PUBLIC TENDERING PROCESSES

Thanks for your attention
